# *Energy Exchange Between Atmospheric Molecules*

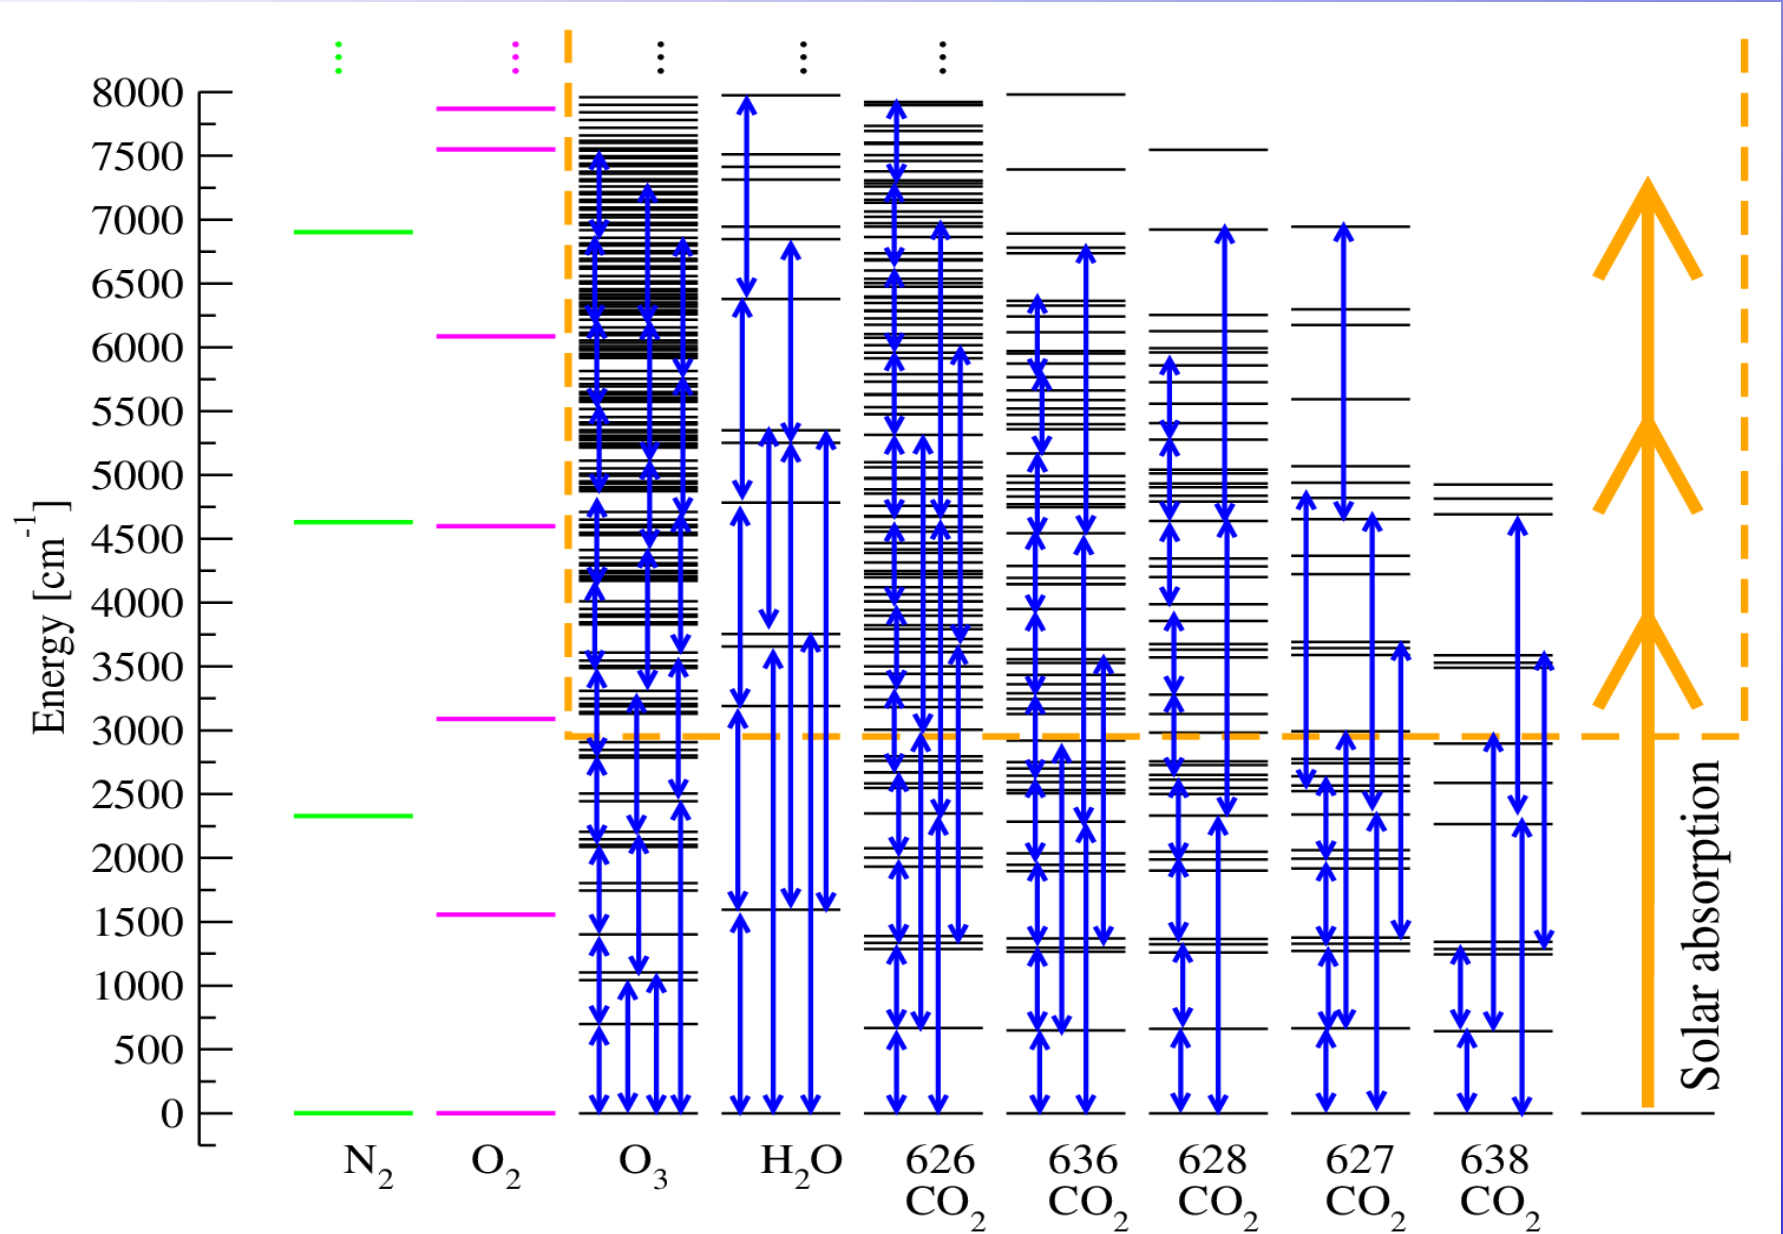

# *LTE and non-LTE: two-level atom*

# *Vibrational levels and transitions for CO<sub>2</sub>*

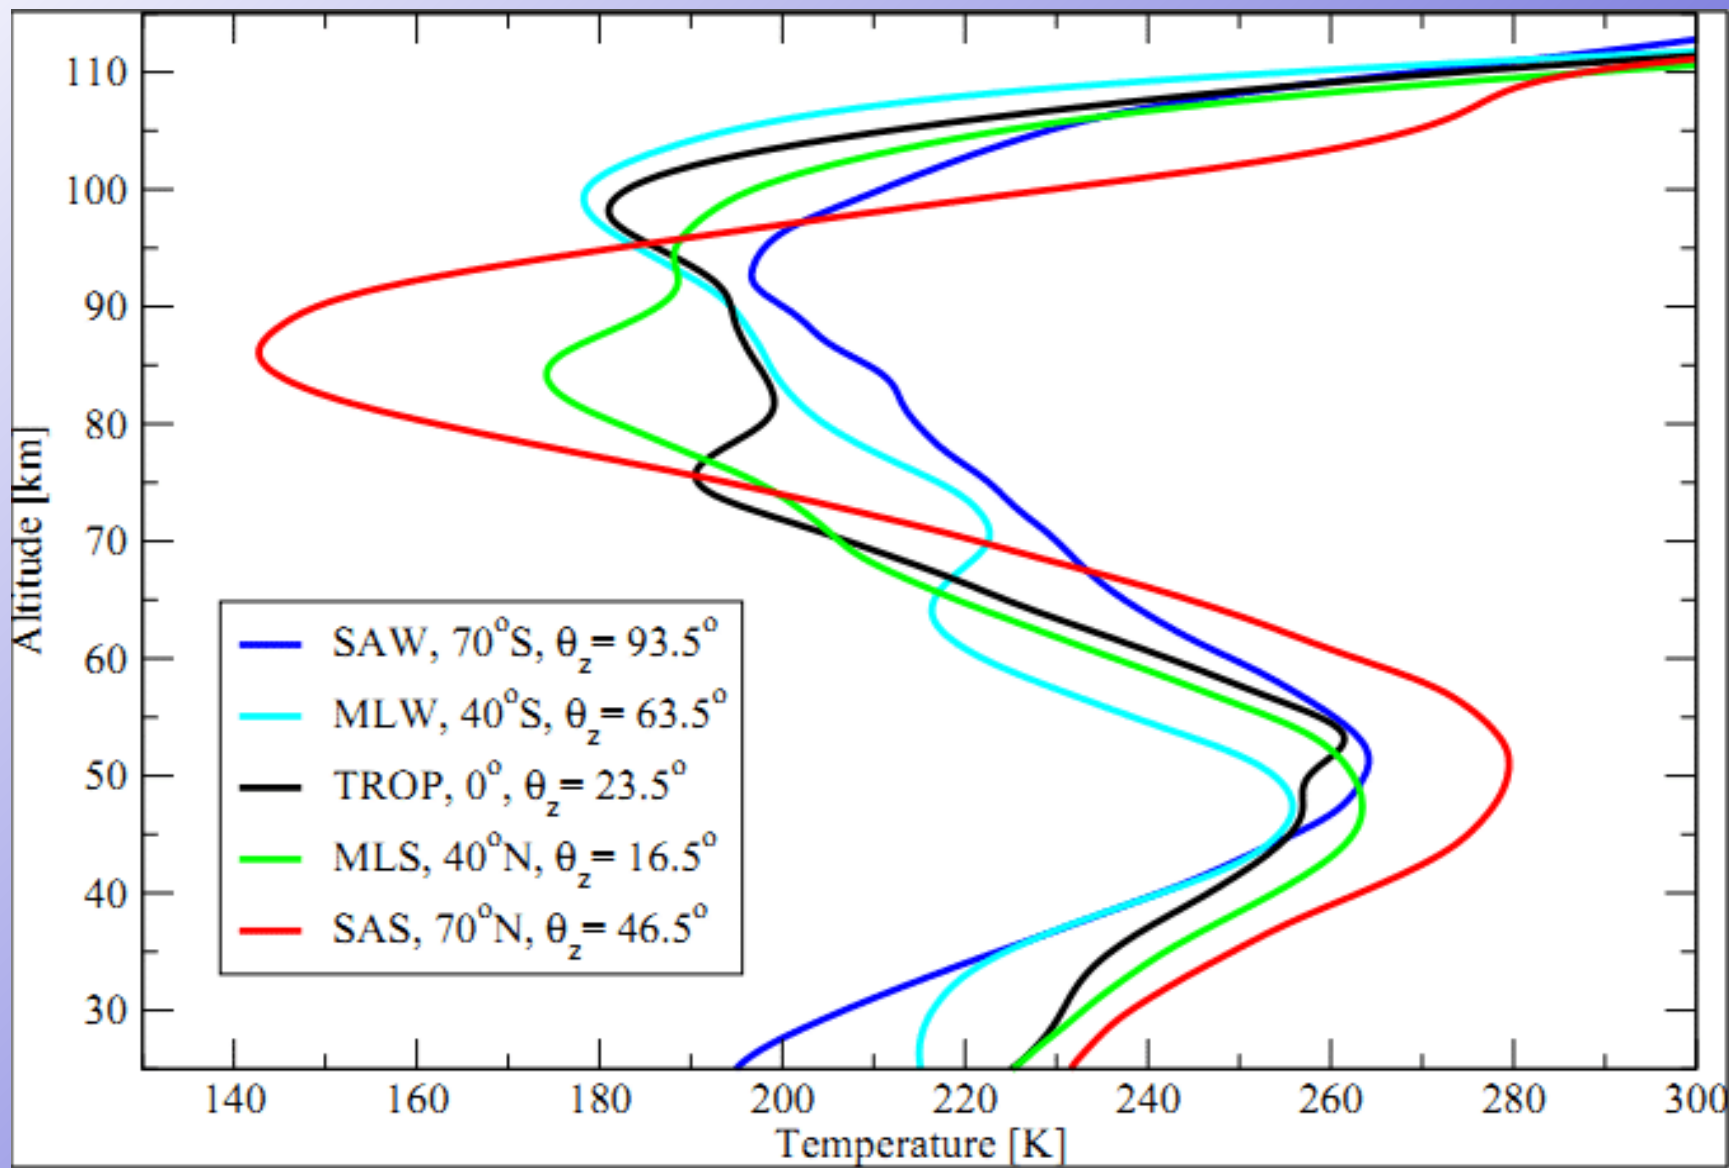

# *Non-LTE calculations: ALI-ARMS research code*

# *CO<sub>2</sub>, O<sub>3</sub>, and H<sub>2</sub>O: three most “interesting” atmospheric molecules*

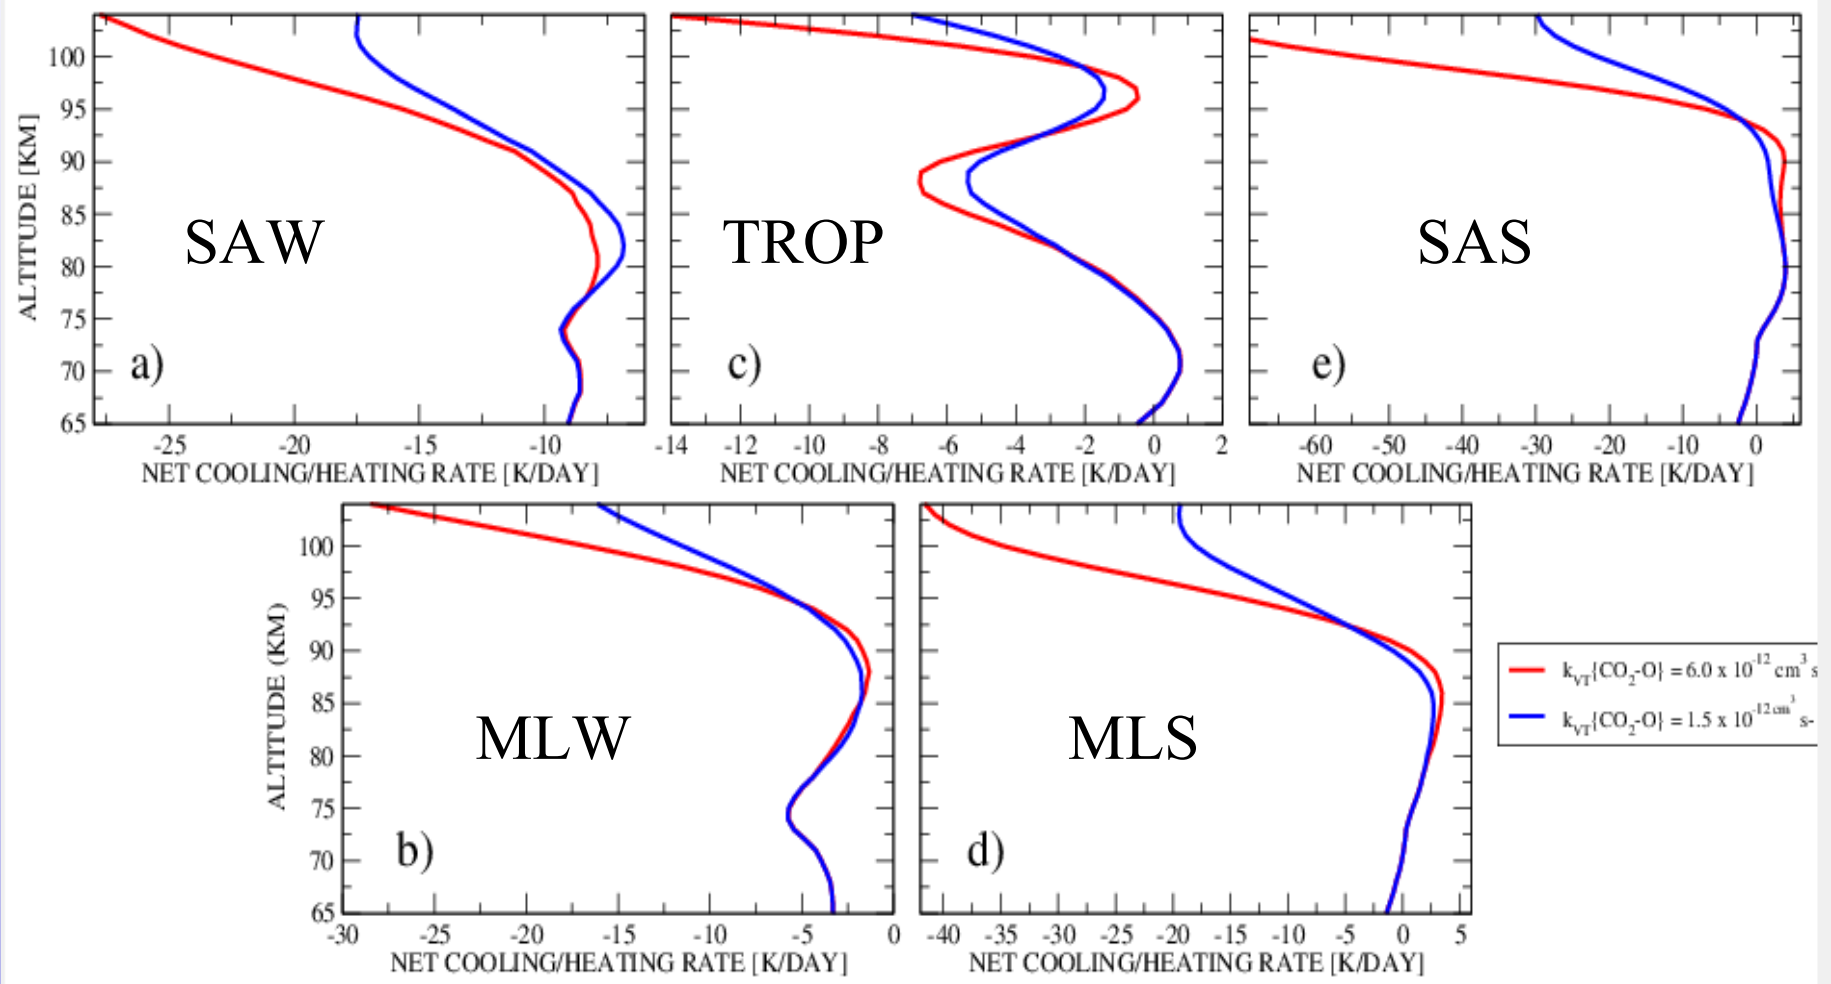

- The vibrational levels of all 3 molecules are in non-LTE in the MLT.
- CO<sub>2</sub>(15 μm) is the main cooler in the MLT.
- O<sub>3</sub>(9.6 μm) is the second in importance.
- O<sub>3</sub> and O<sub>2</sub> photolysis in UV forms O(<sup>1</sup>D), O(<sup>3</sup>P) and electronically and vibrationally excited O<sub>2</sub> coupled with H<sub>2</sub>O.
- H<sub>2</sub>O **rotational** band is the third in importance. However, the non-LTE model is still required for the H<sub>2</sub>O retrievals from the 6.3 μm radiance measurements.

# *Five test atmospheric models: temperature profiles*

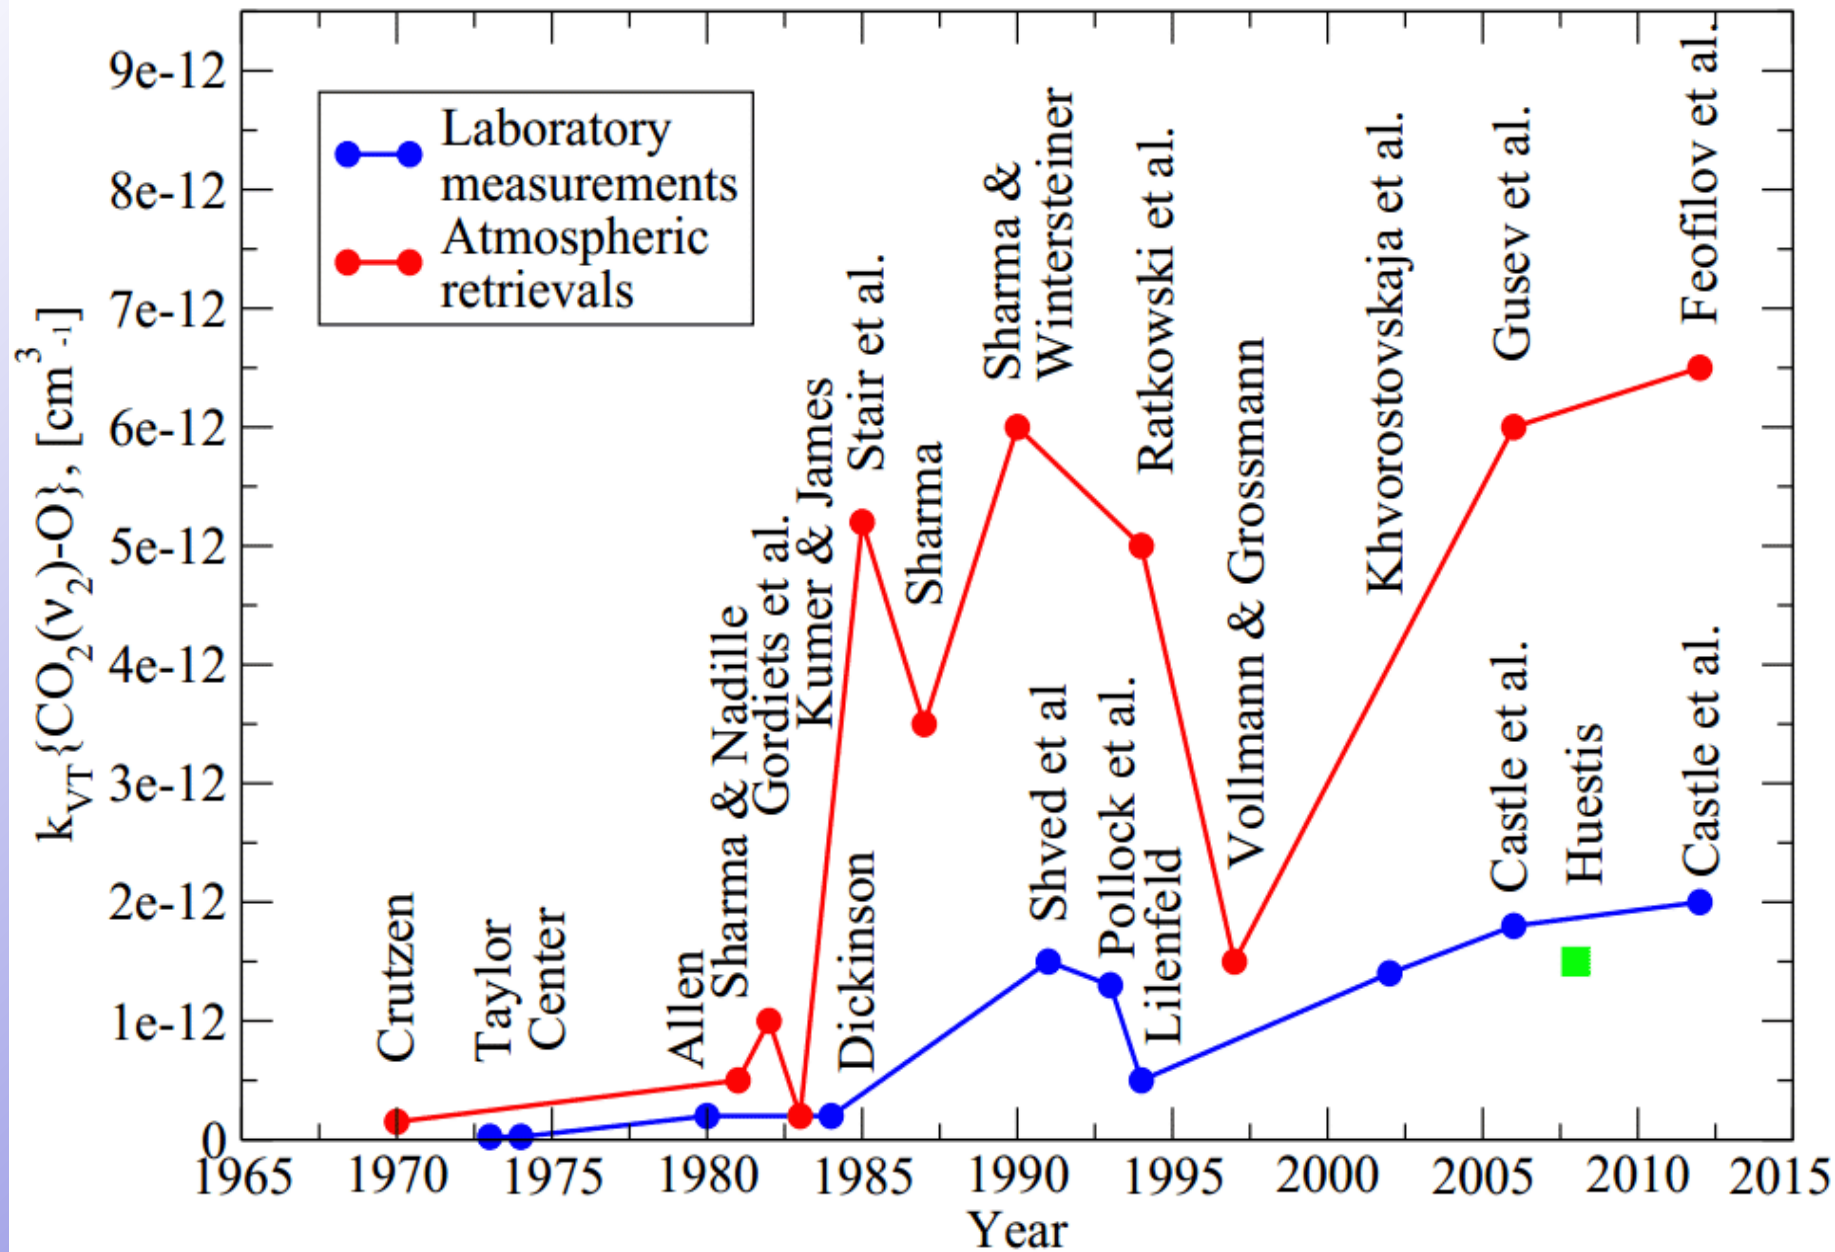

# $CO_2$ cooling/heating rates

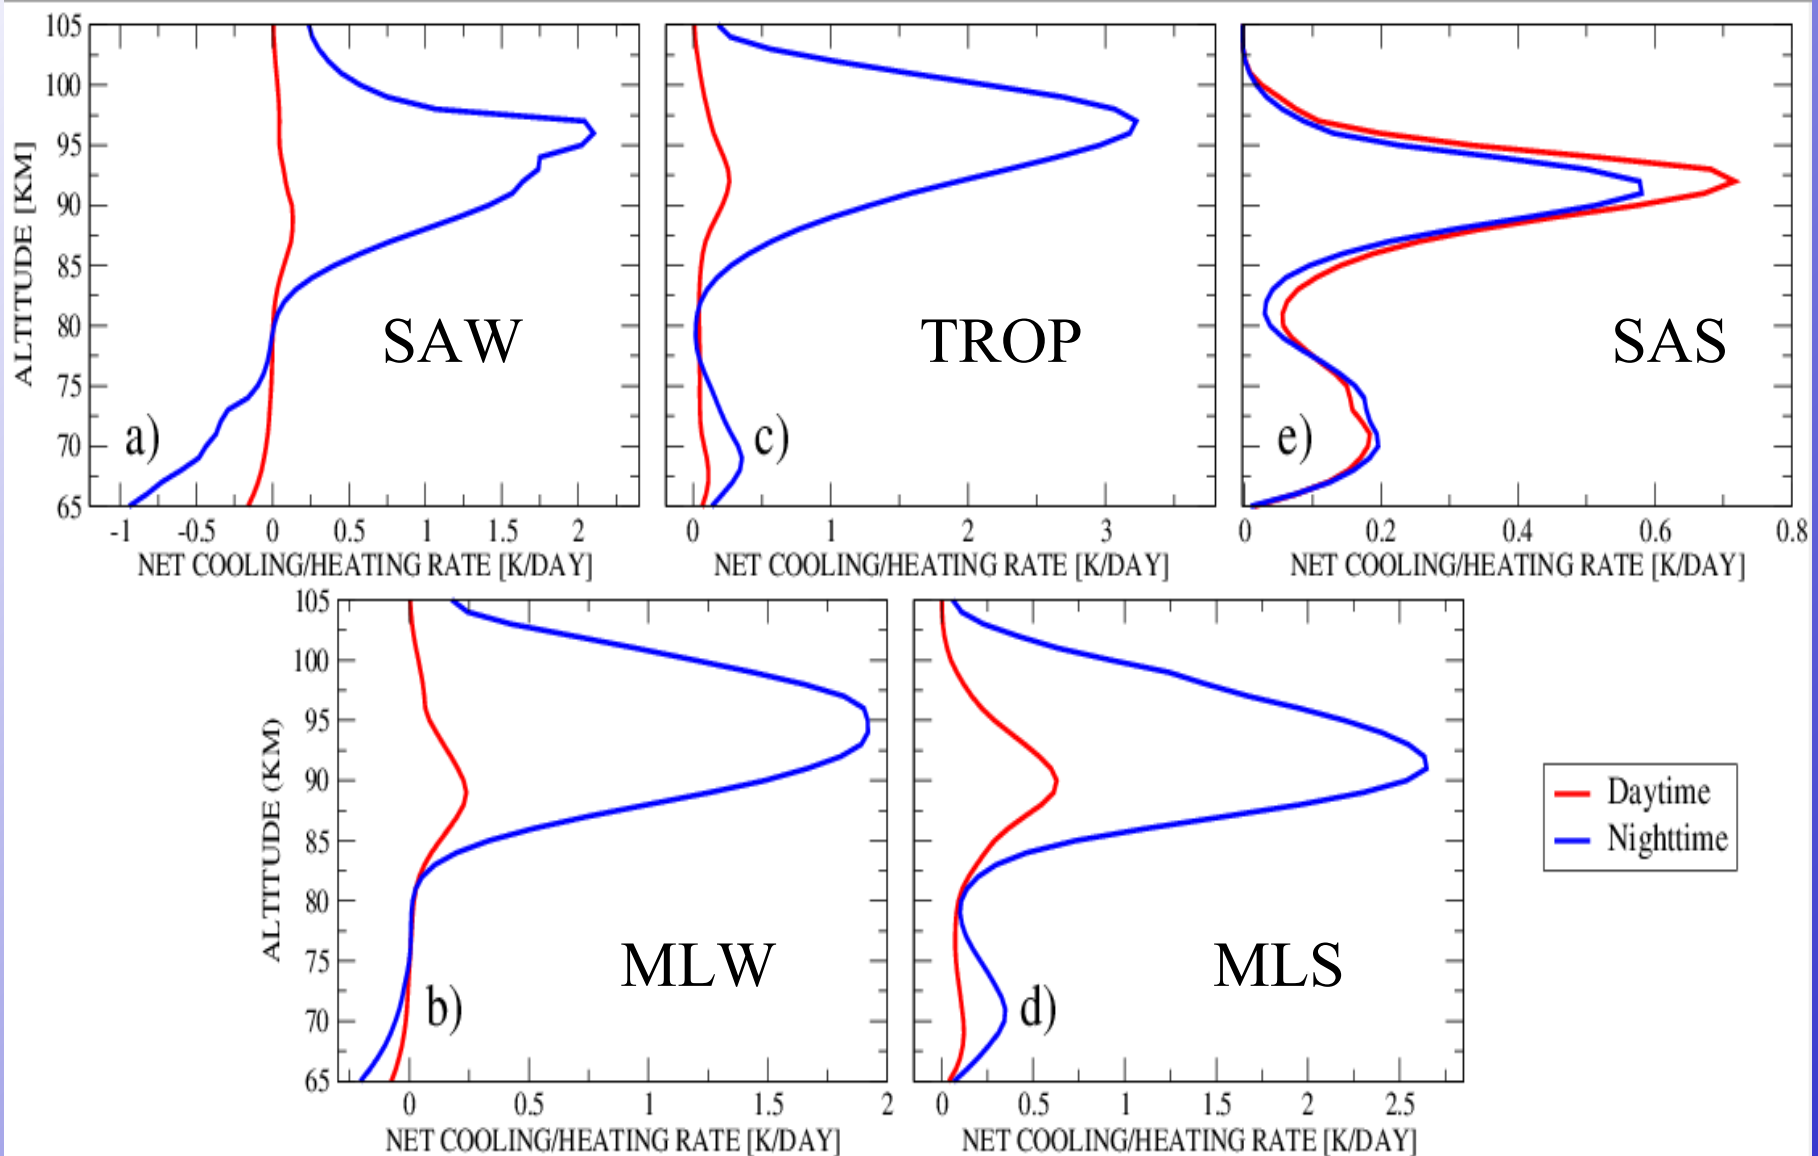

Note two sets of curves calculated for two values of  $CO_2(v_2)$ -O quenching rate coefficient

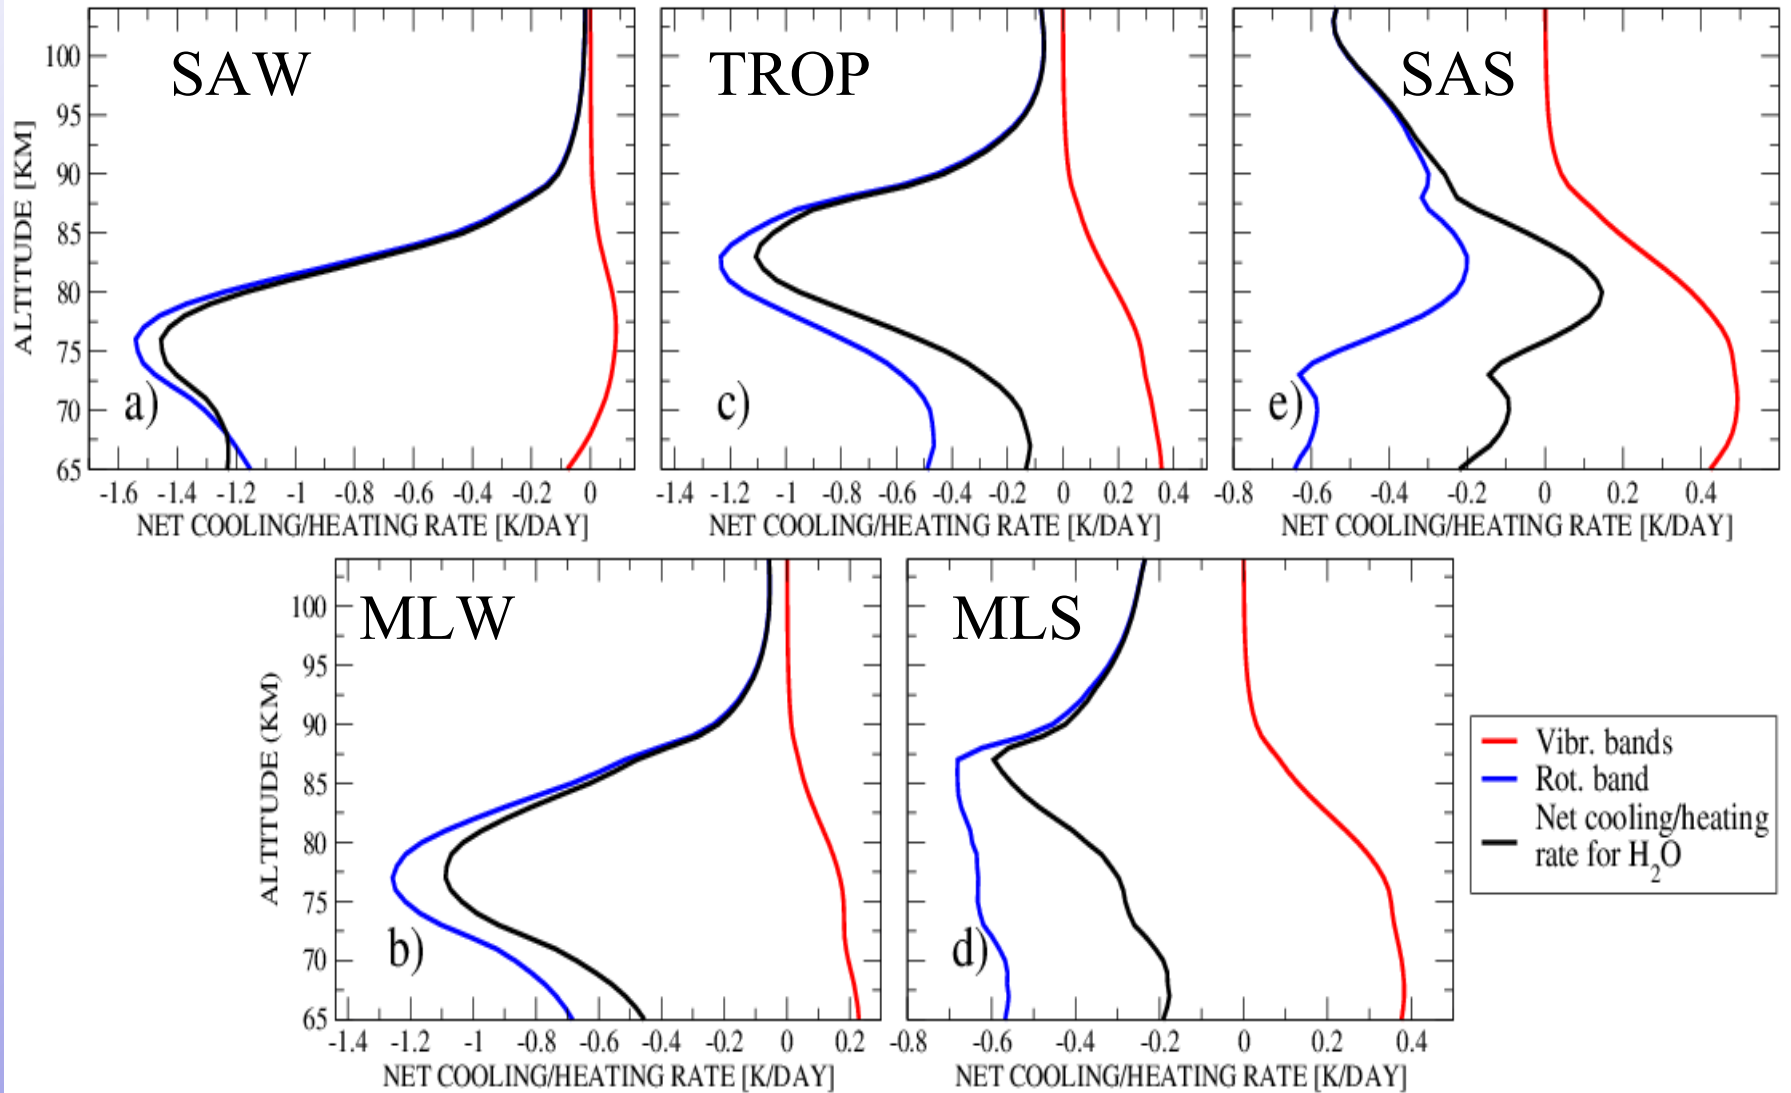

# Historical review of $k_{VT}\{CO_2-O\}$ measurements

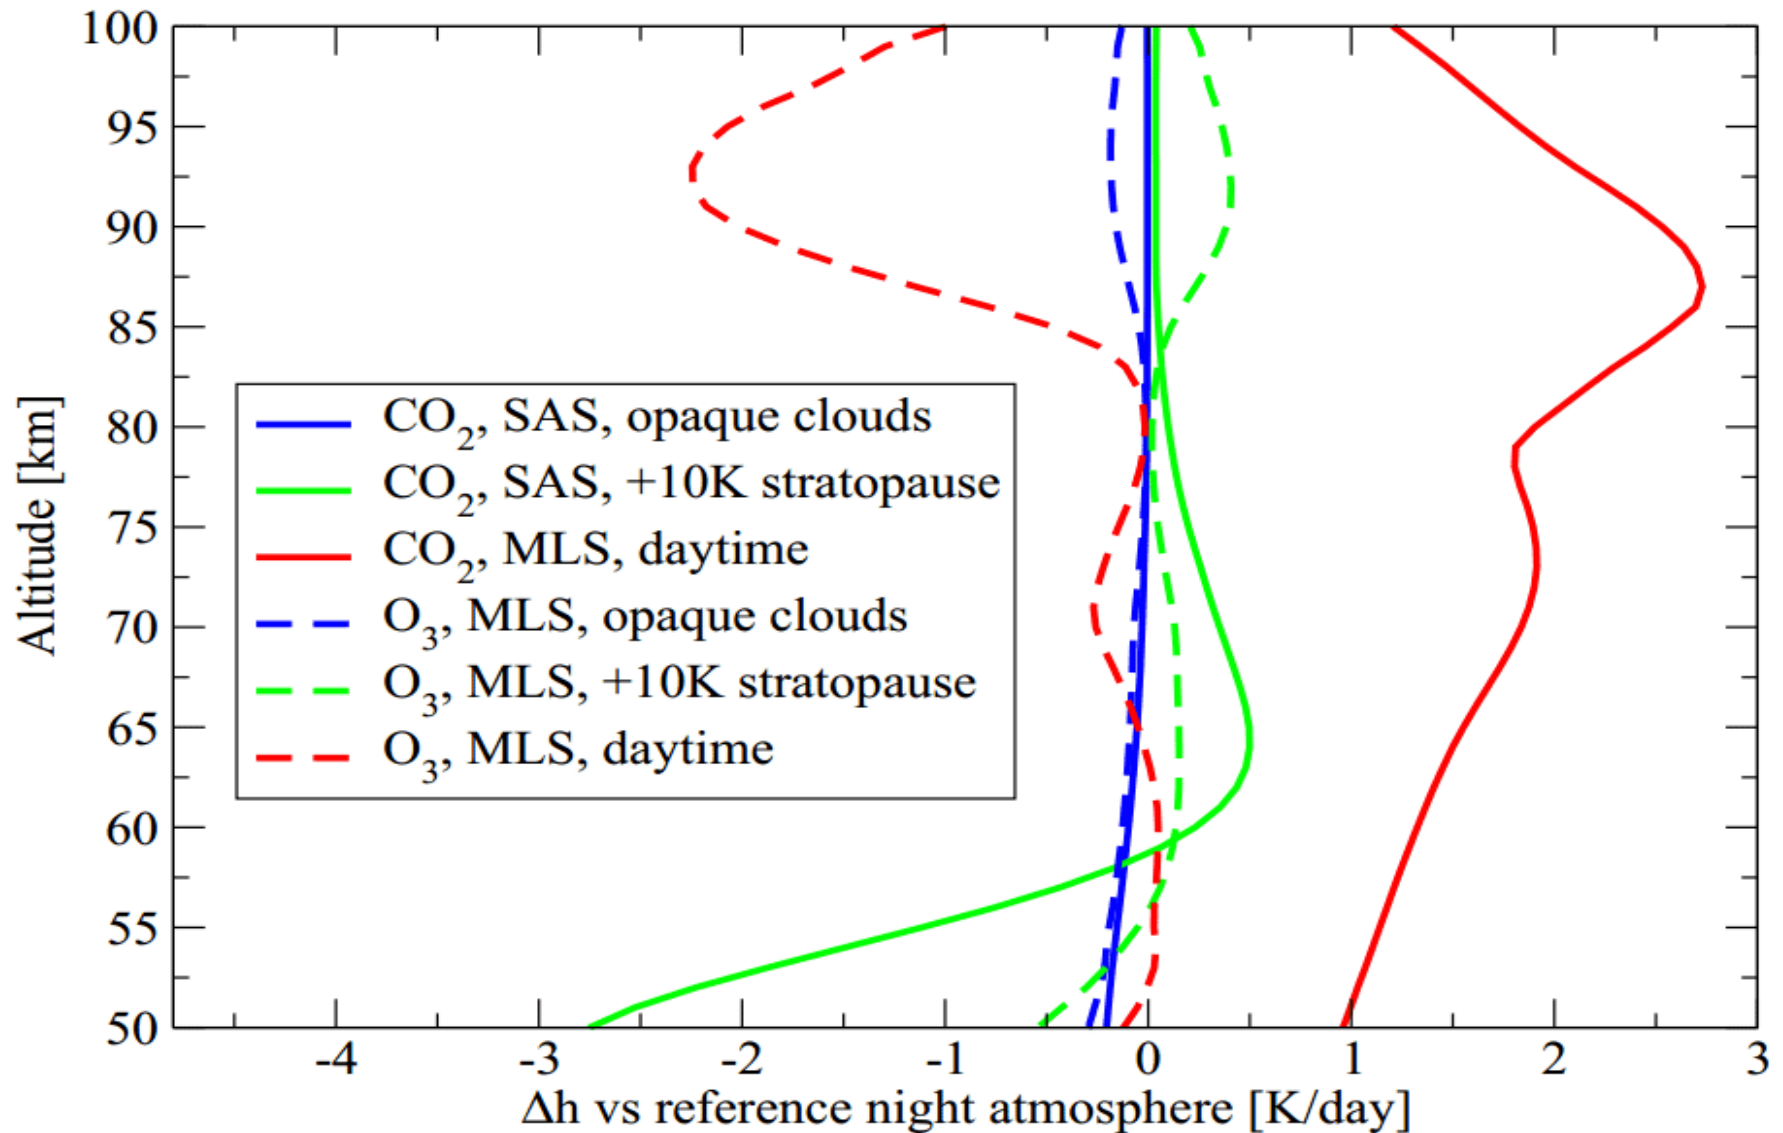

# $O_3$ cooling/heating rates

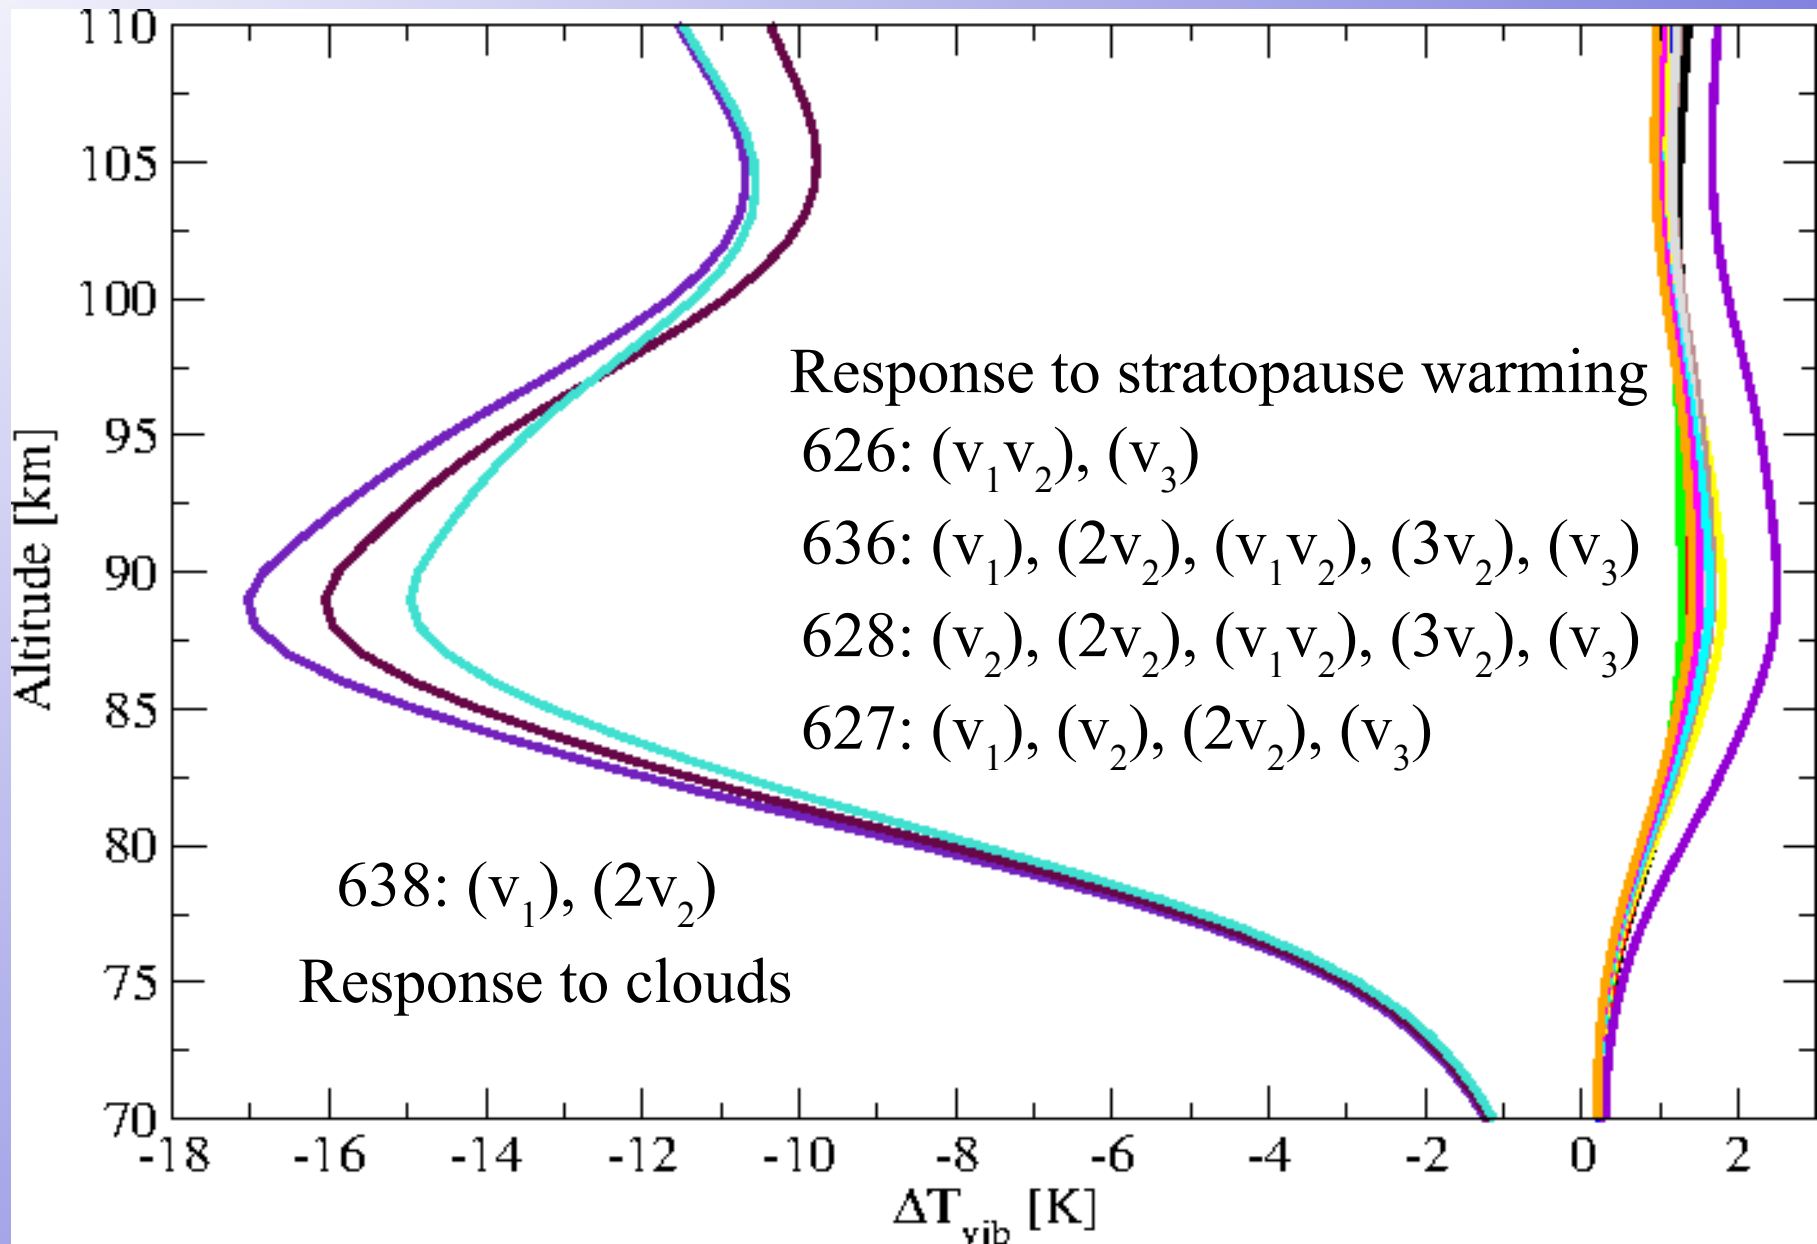

# *H<sub>2</sub>O cooling/heating rates in rotational and vibrational bands*

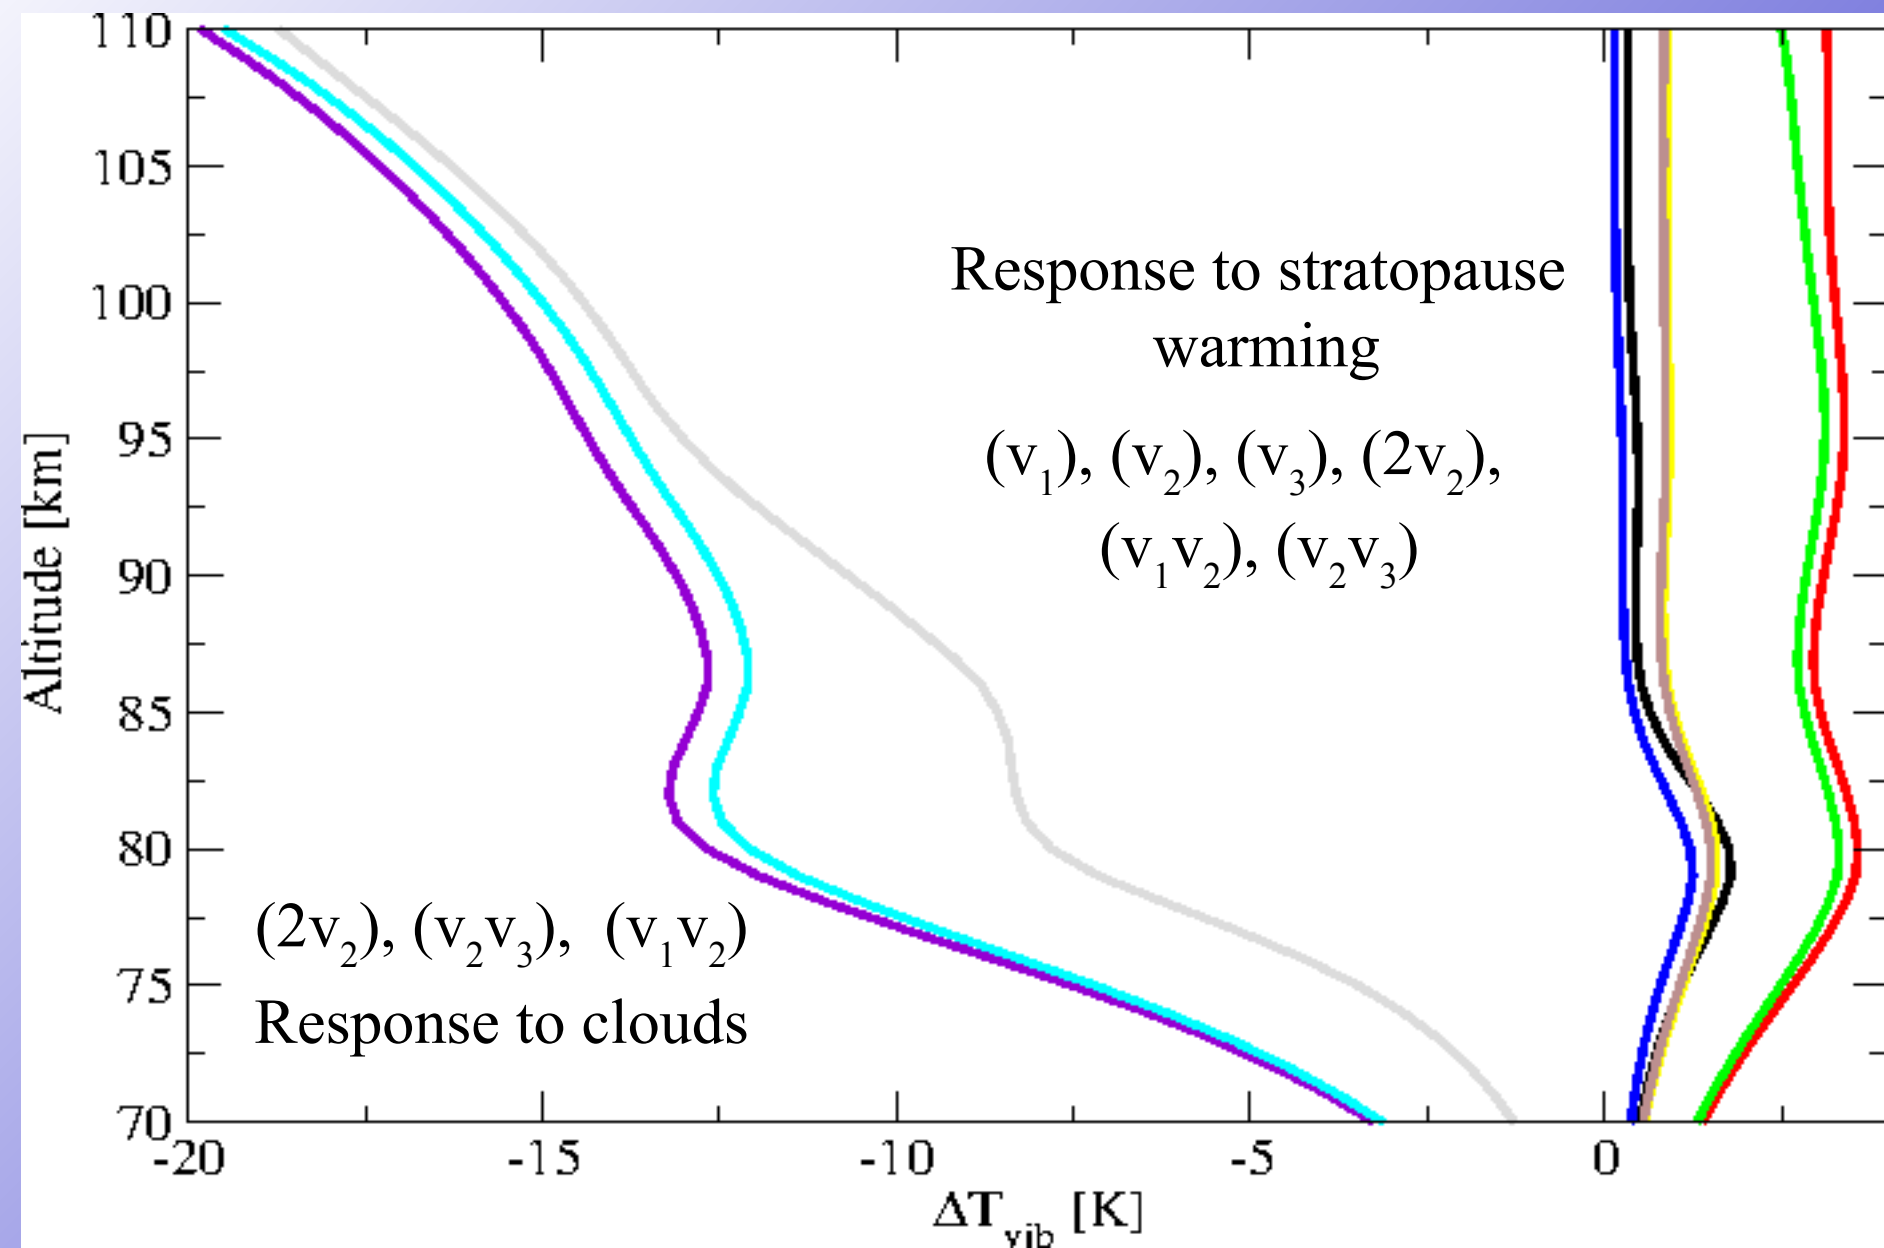

# *MLT sensitivity to clouds, stratopause T, and solar pumping changes*

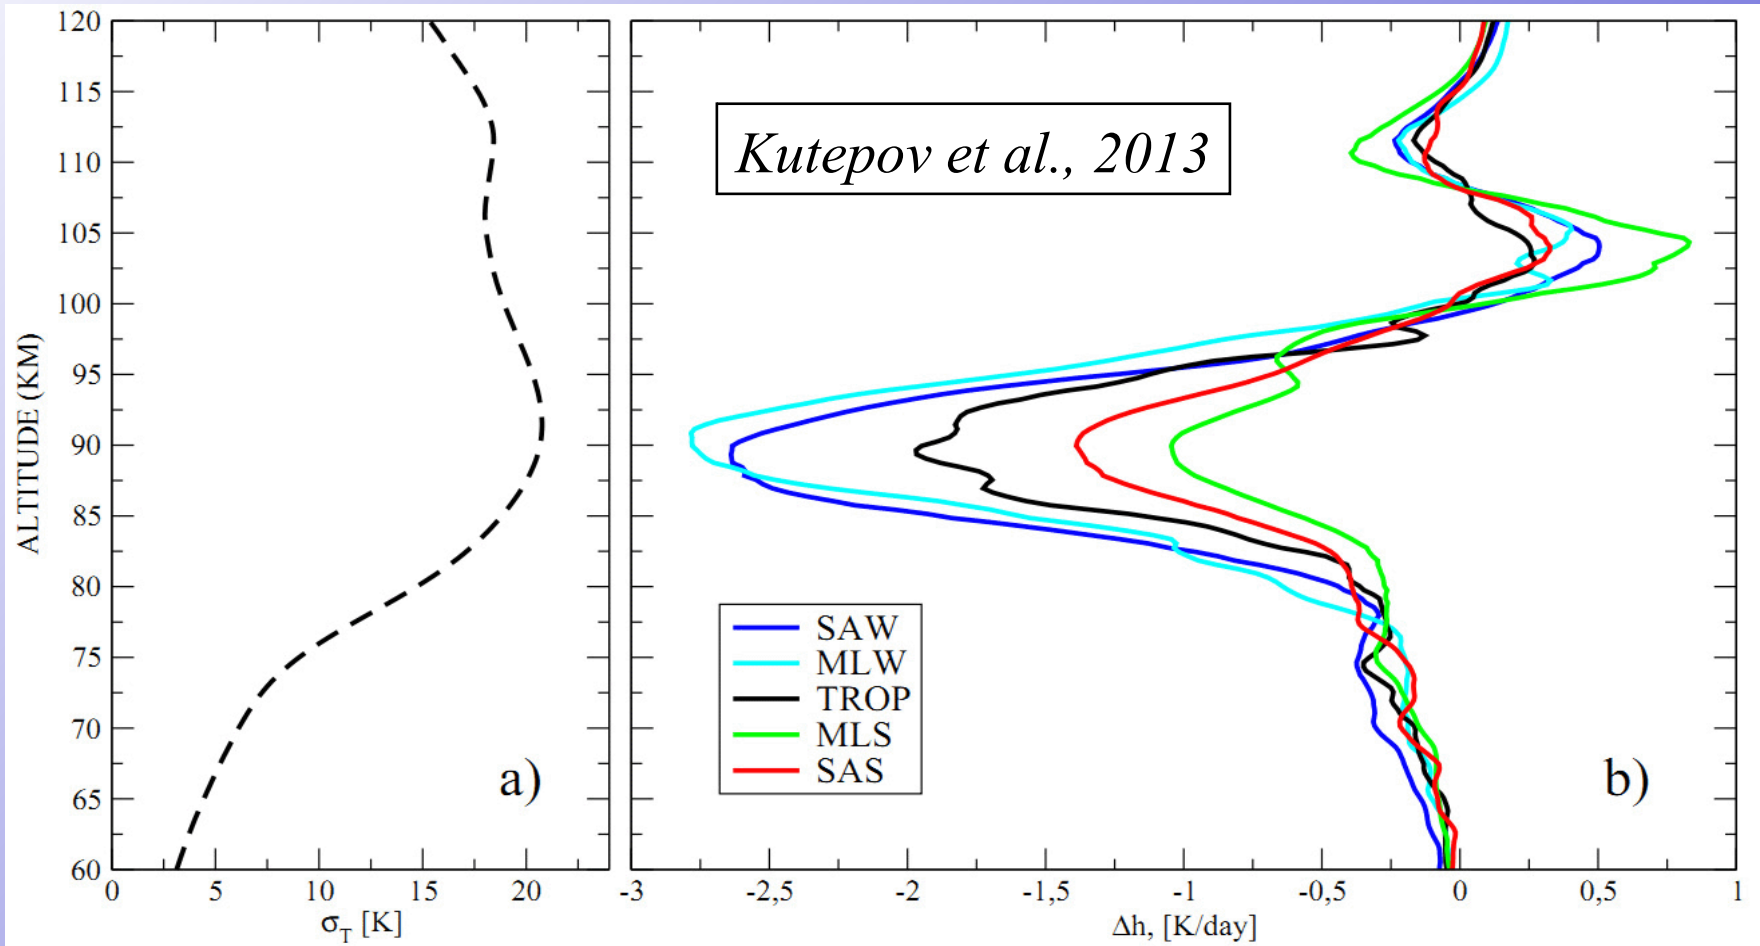

# *CO<sub>2</sub> vibr. levels, sensitive to changes in other layers*

# *$O_3$ vibr. levels, sensitive to changes in other layers*

# *Radiative cooling, associated with GW activity*

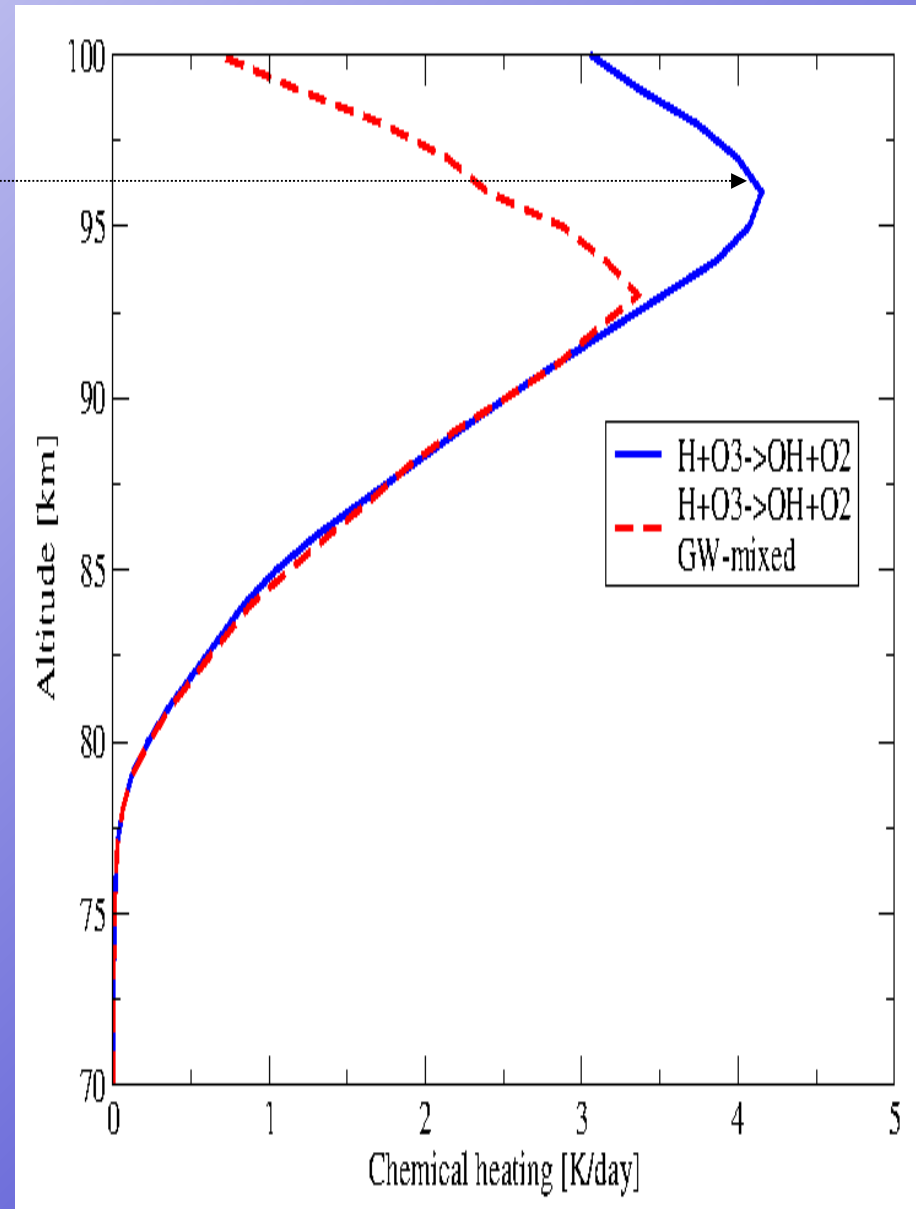

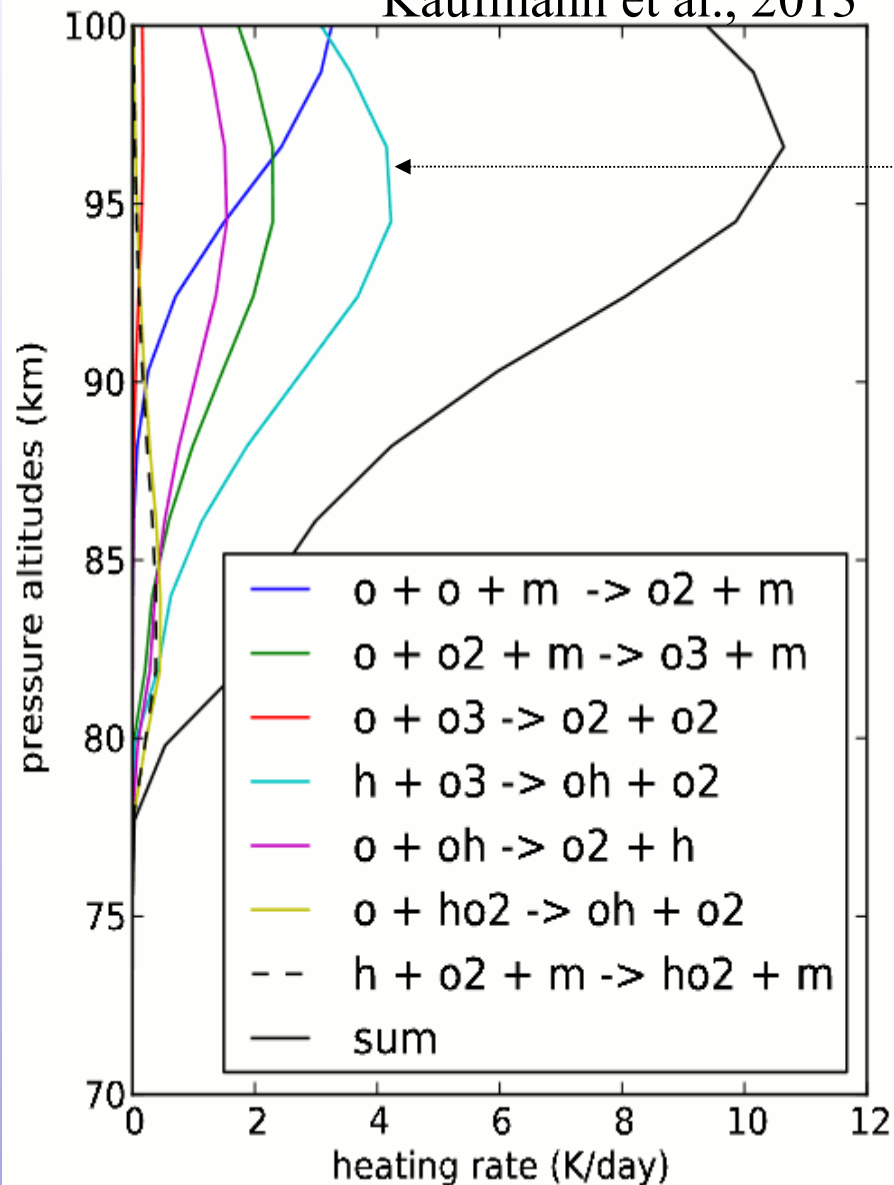

The effect is mainly related to T fluctuations: increased mean local thermal emission vs emission for the non-disturbed T profile (non-linear T dependence of  $B(\nu, T)$ )  
The magnitude depends on r.m.s. of T variation (left panel) and  $\text{CO}_2(z)$  and  $\text{O}(z)$  vertical gradients:  $\text{CO}_2$  fluctuations decrease the effect, while O fluctuations increase it.

Kaufmann et al., 2013

# *Take home messages*

- ✓ IR cooling/heating in 65-105 km altitude range:  
CO<sub>2</sub>(15μm): -(15-50) K/day, depending on T and  $k_{VT}$  rate coeff.  
O<sub>3</sub>(9.6μm): -1...+3 K/day  
H<sub>2</sub>O(6.3μm vibr. and ~20μm rot. band): -1.5...+0.5 K/day
- ✓ Energetic effects of direct radiative coupling with tropo- and stratosphere are less than 1 K/day
- ✓ Changes in lower atmosphere affect vibrational levels, which are pumped by radiation coming in optically thin lines.
- ✓ Atmospheric fluctuations associated with gravity waves cause additional radiative cooling (up to 3 K/day) and also lead to changes in chemical heating (~ 2 K/day)
